## A-level PHYSICS

## Paper 3

Section B Turning points in physics

## Materials

For this paper you must have:

- a pencil and a ruler
- a scientific calculator
- a Data and Formulae Booklet
- a protractor.

Time allowed: The total time for both sections of this paper is 2 hours. You are advised to spend approximately
50 minutes on this section.

## Instructions

- Use black ink or black ball-point pen.
- Fill in the boxes at the top of this page.
- Answer all questions.
- You must answer the questions in the spaces provided. Do not write outside the box around each page or on blank pages.
- If you need extra space for your answer(s), use the lined pages at the end of this book. Write the question number against your answer(s).
- Do all rough work in this book. Cross through any work you do not want

## Information

- The marks for questions are shown in brackets.
- The maximum mark for this paper is 35 .
- You are expected to use a scientific calculator where appropriate.
- A Data and Formulae Booklet is provided as a loose insert.

| $\mathbf{0}$ | $\mathbf{1}$ | .1 |
| :--- | :--- | :--- | The student observes two bright white lines on the screen.

Explain how this observation supports Newton's theory of light.

| $\mathbf{0}$ | $\mathbf{1}$. | $\mathbf{2}$ The student makes alterations to the apparatus in Figure 1. |
| :--- | :--- | :--- |

Figure 2 shows the red and dark fringes that the student now observes on the screen.
Figure 2

Identify the alterations made by the student and explain how the observations in Figure 2 support Huygens' theory of light.

In your answer you should:

- identify alterations made to the apparatus in Figure 1
- outline the key features of Huygens' theory
- explain how the result of this experiment supports Huygens' theory.

| $\mathbf{0}$ | $\mathbf{1}$ | $\mathbf{3}$ | Shortly before the work of Newton and Huygens, Francesco Grimaldi carried out an |
| :--- | :--- | :--- | :--- | experiment into the behaviour of light. Figure 3 shows Grimaldi's arrangement.

Figure 3

A B

C
D
screen
A bright white light source is used to illuminate a small circular aperture, AB.
The light from this aperture illuminates a second, slightly larger circular aperture, CD.
The light passing through both apertures arrives at a screen.
Newton's theory and Huygens' theory make different predictions about the appearance of the light on the screen.

Discuss these differences in appearance.

| $\mathbf{0}$ | $\mathbf{2}$ Robert Millikan experimented with oil drops to determine a value for the electronic |
| :--- | :--- | charge.

Figure 4 shows a stationary oil droplet between two horizontal metal plates. The plates are connected to a variable voltage supply so that the upper plate is positive. The oil droplet has mass $m$ and charge $Q$.

Figure 4

| $\mathbf{0}$ | $\mathbf{2}$. | $\mathbf{1}$ State and explain the sign of the charge on the oil droplet. |
| :--- | :--- | :--- |

$\qquad$
$\qquad$
$\qquad$

The variable voltage supply is set to zero volts. The oil drop falls. The constant speed $v_{1}$ of the falling oil droplet is found to be $3.8 \times 10^{-5} \mathrm{~m} \mathrm{~s}^{-1}$ and the following measurements are recorded:

$$
\begin{aligned}
& \text { density of oil }=910 \mathrm{~kg} \mathrm{~m}^{-3} \\
& \text { viscosity of air }=1.8 \times 10^{-5} \mathrm{~N} \mathrm{~s} \mathrm{~m}^{-2}
\end{aligned}
$$

| $\mathbf{0}$ | $\mathbf{2}$. | $\mathbf{3}$ The variable voltage supply is adjusted so that the oil droplet rises at a constant |
| :--- | :--- | :--- | :--- | speed $v_{2}$. The potential difference ( pd ) across the plates is $V$ and the distance between the plates is $d$.

In his experiment, Millikan measured the constant speed $v_{1}$ of a falling droplet when the pd was zero. He compared this with the speed $v_{2}$ of the same droplet when the droplet was made to rise.

Show that

$$
\frac{v_{2}}{v_{1}}=\frac{V Q}{d m g}-1
$$

$\begin{array}{lll}0 & 2 & 4 \\ 4\end{array}$ rising at constant speed.

$$
\begin{aligned}
& V=715 \mathrm{~V} \\
& v_{2}=1.1 \times 10^{-4} \mathrm{~m} \mathrm{~s}^{-1}
\end{aligned}
$$

The separation of the plates $d=11.6 \mathrm{~mm}$.
Deduce, using the equation in Question 02.3, whether the value of the charge for this droplet is consistent with the currently accepted value of the electronic charge.

| $\mathbf{0}$ | $\mathbf{2} .5$ After Millikan published his results, it was found that he had used a value for the |
| :--- | :--- | :--- | viscosity of air that was smaller than the actual value.

Discuss the effect this error had on Millikan's value of the electronic charge.

Figure 5

The toothed wheel $\mathbf{W}$ is rotated and the reflected light from a distant mirror $\mathbf{M}$ is observed.

The speed of light is calculated from the equation

$$
c=4 d n f_{0}
$$

where
$d$ is the distance from $\mathbf{W}$ to $\mathbf{M}$ and $n$ is the number of teeth on the rotating wheel $\mathbf{W}$.

| $\mathbf{0}$ | $\mathbf{3}$ |
| :--- | :--- | :--- | $\mathbf{1}$ State what $f_{0}$ represents in the equation.

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$

| $\mathbf{0}$ | $\mathbf{3} .2$ | The experiment is attempted using a rotating wheel with 720 teeth that can be rotated |
| :--- | :--- | :--- | :--- | at up to 620 revolutions per minute.

The distance between $\mathbf{W}$ and $\mathbf{M}$ is 8.5 km .
Deduce whether the speed of light can be determined with this particular arrangement.

| $\mathbf{0}$ | $\mathbf{3} .3$ | $\mathbf{3}$ The determination of the speed of light took on extra significance when Maxwell |
| :--- | :--- | :--- | :--- | derived the wave-speed equation

$$
c=\frac{1}{\sqrt{\varepsilon_{0} \mu_{0}}}
$$

State how $\varepsilon_{0}$ and $\mu_{0}$ are related to the types of field in the wave.
