

**You may not need to use all of the materials provided.**

**1** In this experiment, you will investigate an electrical circuit.

- (a)**
- Place the  $15\ \Omega$  resistor in component holder P.
  - Place the  $22\ \Omega$  resistor in component holder Q.
  - Set up the circuit shown in Fig. 1.1.

**Fig. 1.1**

- K and L are crocodile clips.

The resistors in the component holders have resistances  $P$  and  $Q$ .

Place L approximately half-way along the wire.

- The distance between K and L is  $y$  as shown in Fig. 1.1.

Record  $P$ ,  $Q$  and  $y$ .

$P =$  .....

$Q =$  .....

$y =$  .....

- Close the switch.
- Record the ammeter reading  $I$ .

$I =$  .....

- Open the switch.

[1]

3

- (b) • Change one or both of the resistors in P and Q.
- Record the new values of  $P$  and  $Q$ .

 $P =$  ..... $Q =$  .....

- Close the switch.
- Change the position of L on the wire so that the ammeter reading is as close as possible to the value for  $I$  in (a).
- Record  $y$ .

 $y =$  .....

- Open the switch.

[1]

- (c) Repeat (b) until you have six sets of readings of  $P$ ,  $Q$  and  $y$ . Include your readings from (a) and (b).

Record your results in a table. Include values of  $\frac{PQ}{P+Q}$  in your table.

- (d) (i) Plot a graph of  $y$  on the  $y$ -axis against  $\frac{PQ}{P+Q}$  on the  $x$ -axis. [9]  
(ii) Draw the straight line of best fit. [3]  
(iii) Determine the gradient and  $y$ -intercept of this line. [1]

gradient = .....

$y$ -intercept = .....

[2]

- (e) It is suggested that the quantities  $y$ ,  $P$  and  $Q$  are related by the equation

$$y = -\frac{MPQ}{P+Q} + N$$

where  $M$  and  $N$  are constants.

Using your answers in (d)(iii), determine values for  $M$  and  $N$ .  
Give appropriate units.

$M =$  .....

$N =$  .....  
[2]

- (f) Theory suggests that

$$\frac{N}{M} = \frac{E}{I}$$

where  $E$  is the electromotive force (e.m.f.) of the cell.

Calculate  $E$ . Give an appropriate unit.

$E =$  .....[1]

[Total: 20]

**You may not need to use all of the materials provided.**

**2** In this experiment, you will investigate the equilibrium of a system of three identical springs.

**(a)** You have been provided with three springs attached to a ring.

Measure and record the unstretched length  $S$  of the coiled section of one of the springs, as shown in Fig. 2.1.

**Fig. 2.1**

$S =$  .....[1]

- (b) (i) • Set up the apparatus as shown in Fig. 2.2.

**Fig. 2.2**

- The total mass  $m$  of the mass hanger and the slotted masses should be 0.300 kg.
- Adjust the position of the bosses so that the centres of the rods of the clamps are at the same height above the bench.
- Change the separation of the stands until the angle between the springs is  $90^\circ$ .

- The lengths  $S_1$  and  $S_2$  of the coiled sections of the two springs attached to the ring are shown in Fig. 2.3.

The angle between the single spring and the vertical is  $\theta$ .

**Fig. 2.3**

Measure and record  $m$ ,  $S_1$ ,  $S_2$  and  $\theta$ .

$m =$  ..... kg

$S_1 =$  .....

$S_2 =$  .....

$\theta =$  ..... °

[2]

- (ii) Estimate the percentage uncertainty in your value of  $\theta$ .

percentage uncertainty = ..... [1]

(iii) Calculate  $e_1 \cos \theta$  and  $e_2 \sin \theta$  where

$$e_1 = S_1 - S \quad \text{and} \quad e_2 = S_2 - S.$$

$$e_1 \cos \theta = \dots\dots\dots$$

$$e_2 \sin \theta = \dots\dots\dots$$

[1]

(iv) Justify the number of significant figures that you have given for your value of  $e_1 \cos \theta$ .

.....  
.....  
.....[1]

(c) Change  $m$  to 0.600 kg and repeat (b)(i) and (b)(iii).

$$m = \dots\dots\dots \text{ kg}$$

$$S_1 = \dots\dots\dots$$

$$S_2 = \dots\dots\dots$$

$$\theta = \dots\dots\dots^\circ$$

$$e_1 \cos \theta = \dots\dots\dots$$

$$e_2 \sin \theta = \dots\dots\dots$$

[3]

- (d) It is suggested that the relationship between  $e_1$ ,  $e_2$ ,  $\theta$  and  $m$  is

$$e_1 \cos \theta + e_2 \sin \theta = \beta m$$

where  $\beta$  is a constant.

- (i) Using your data, calculate two values of  $\beta$ .

first value of  $\beta =$  .....

second value of  $\beta =$  ..... [1]

- (ii) Explain whether your results support the suggested relationship.

.....  
.....  
.....  
..... [1]

- (e) Theory suggests that

$$\beta = \frac{g}{k}$$

where the acceleration of free fall  $g$  is  $9.81 \text{ m s}^{-2}$  and  $k$  is the spring constant of a spring.

Using your second value of  $\beta$ , calculate  $k$ . Give an appropriate unit.

$k =$  ..... [1]

(f) (i) Describe four sources of uncertainty or limitations of the procedure for this experiment.

1. ....  
.....
  2. ....  
.....
  3. ....  
.....
  4. ....  
.....
- [4]

(ii) Describe four improvements that could be made to this experiment. You may suggest the use of other apparatus or different procedures.

1. ....  
.....
  2. ....  
.....
  3. ....  
.....
  4. ....  
.....
- [4]
