You must have: Ruler		Total Marks

## **Instructions**

- Use **black** ink or ball-point pen.
- **Fill in the boxes** at the top of this page with your name, centre number and candidate number.
- Answer all questions.
- Answer the questions in the spaces provided
  - there may be more space than you need.

### Information

- The total mark for this paper is 40.
- The marks for **each** question are shown in brackets
  - use this as a guide as to how much time to spend on each question.
- The list of data, formulae and relationships is printed at the end of this booklet.
- Candidates may use a scientific calculator.

### **Advice**

- Read each question carefully before you start to answer it.
- Try to answer every question.
- Check your answers if you have time at the end.

1	A stude	ent has a sample of wire made of an unknown metal.	
	In orde	r to identify the metal, she determines its resistivity.	
	(a) The	e student estimates that the diameter of the wire is approximately 0.5 mm.	
	She	e measures the diameter of the wire using a micrometer screw gauge.	
	(i)	Explain why the micrometer screw gauge is an appropriate instrument for this	
		measurement.	(2)
	(ii)	Describe two techniques she should use to make this measurement as accurate as	
		possible.	(2)
	(iii)	She measures the diameter as $0.275\text{mm} \pm 0.003\text{mm}$ .	
		Calculate the percentage uncertainty in the measurement of the diameter.	(d)

	the wire and obtains the	following results
length = $0.800 \mathrm{m} \pm 0.001 \mathrm{m}$		
resistance = $6.48 \Omega \pm 0.03 \Omega$		
(i) Calculate the resistivity of the metal.		
		(2)
	Resistivity =	
ii) Calculate the percentage uncertainty in your va	llue of resistivity.	
		(3)
Pe	rcentage uncertainty =	

(c) The table lists the resistivity of some metals used in resistance wires.

Metal	Resistivity/Ω m
constantan	$4.9 \times 10^{-7}$
copper	$1.7 \times 10^{-8}$
mild steel	$1.5 \times 10^{-7}$
nichrome	$1.1 \times 10^{-6}$

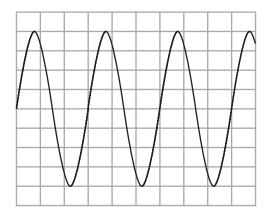

Explain which metal the wire is most likely to be made from.	(8)

2 (a) A student connects a variable frequency signal generator to an oscilloscope.

The oscilloscope displays how the output from the signal generator varies with time as shown.

On the horizontal scale of the oscilloscope screen, one division represents 50 ms.

Show that the frequency of the signal is about 6.7 Hz.

(2)

(b) The student uses the variable frequency signal generator as a variable alternating current power supply and connects it to a coil of wire.

A coil of wire has a property known as impedance Z, which is given by

$$Z = \frac{V}{I}$$

where V is the potential difference across the coil and I is the alternating current through the coil.

Z is thought to vary with the frequency f of the alternating current as

$$Z^2 = 4\pi^2 L^2 f^2 + K^2$$

where L and K are constants.

100	r plan should include:	
(i)	any additional components required,	(1)
(ii)	the measurements to be taken,	(2)
(iii)	how the measurements will be used,	(3)
(iv)	a sketch of the expected graph.	(1)

Number of molecules of air =	
	(=)
Calculate the number of molecules of air in the syringe.	(2)
(b) The investigation is carried out at a temperature of 25 °C.	

4	A student places two polaroid filters together. He notices that when he rotates one filte
	relative to the other, the intensity of transmitted light changes.

He investigates this effect using the arrangement shown.
